## Lipids Lec. 2

Course prof.  
**Dr. Ahmed Mohamed**  
Lecturer at Dep. Of  
Biochemistry

# Rancidity

## Definition:

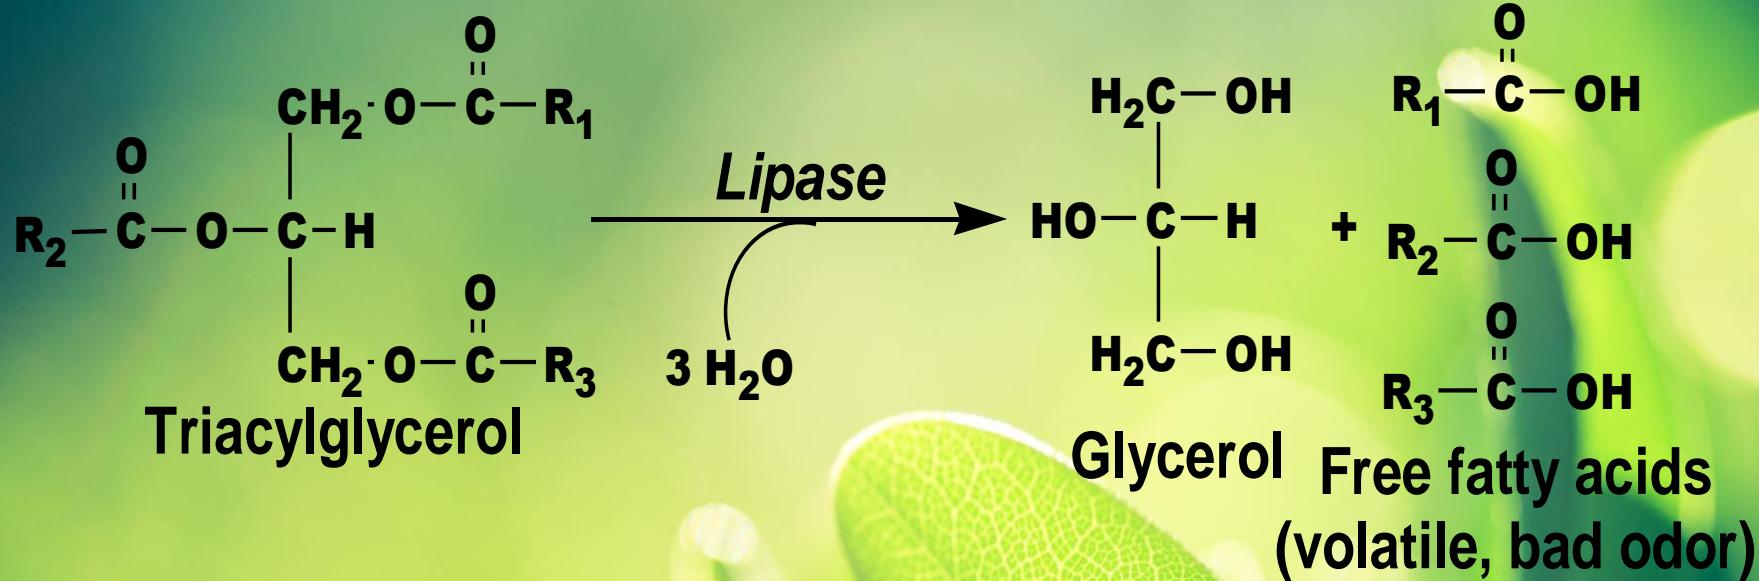

- It is a physico-chemical change in the natural properties of the fat leading to the development of **unpleasant odor or taste or abnormal color** particularly on aging after exposure to atmospheric oxygen, light, moisture, bacterial or fungal contamination and/or heat.
- Saturated fats **resist rancidity** more than unsaturated fats that have unsaturated double bonds.

# **Types and causes of Rancidity**

- **Hydrolytic rancidity**
- **Oxidative rancidity**
- **Ketonic rancidity**

# **1-Hydrolytic rancidity:**

- It results from slight hydrolysis of the fat by **lipase** from bacterial contamination leading to the liberation of free fatty acids and glycerol at high temperature and moisture.
- Volatile short-chain fatty acids have unpleasant odor.

## **2-Oxidative Rancidity:**

- It is oxidation of fat or oil catalyzed by exposure to **oxygen**, light and/or heat producing **peroxide derivatives** e.g., **peroxides, aldehydes, ketones and dicarboxylic acids** that are **toxic and have bad odor.**
- This occurs due to oxidative addition of oxygen at the **unsaturated** double bond of unsaturated fatty acid of oils.

# **Hazards of Rancid Fats:**

- 1. The products of rancidity are toxic, i.e., causes food poisoning and cancer.**
- 2. Rancidity destroys the fat-soluble vitamins (vitamins A, D, K and E).**
- 3. Rancidity destroys the polyunsaturated essential fatty acids.**

# **1-Iodine number (or value):**

- **Definition:** It is the number of **grams of iodine** absorbed by **100 grams** of fat or oil.
- **Uses:** It is a measure for the degree of unsaturation of the fat, as a natural property for it.
- Unsaturated fatty acids absorb iodine at their double bonds, therefore, **as the degree of unsaturation increases iodine number and hence biological value of the fat increase.**
